# Power of 2 Decomposition of a Complete Tripartite Graph $\mathrm{K}_{2,4, \mathrm{M}}$ and a Special Butterfly Graph <br> Check for updates 

V. G. Smilin Shali, S. Asha

#### Abstract

Let $G$ be a finite, connected simple graph with $p$ vertices and $q$ edges. If $G_{1}, G_{2}, \ldots, G_{n}$ are connected edge-disjoint subgraphs of $G$ with $E(G)=E\left(G_{1}\right) \cup E\left(G_{2}\right) \cup \ldots \cup E\left(G_{n}\right)$, then $\left\{G_{1}, G_{2}, \ldots, G_{n}\right\}$ is said to be a decomposition of $G$. A graph $G$ is said to have Power of 2 Decomposition if $G$ can be decomposed into edge-disjoint subgraphs $\left\{G_{2}, G_{4}, \ldots, G_{2^{n}}\right\}$ such that each $G_{2^{i}}$ is connected and $\left|E\left(G_{i}\right)\right|=2^{i}$, for $1 \leq i \leq$ n. Clearly, $q=2\left[2^{n}-1\right]$. In this paper, we investigate the necessary and sufficient condition for a complete tripartite graph $K_{2,4, m}$ and a Special Butterfly graph $B F_{\left[\frac{2^{2 m+1}-5}{3}\right]}$ to

 accept Power of 2 Decomposition.Keywords: Decomposition of Graph, Power of 2
Decomposition, Complete tripartite graph, Special Butterfly graph.

## I . INTRODUCTION

Let $G$ be a simple, connected graph with $p$ vertices and $q$ edges. If $G_{1}, G_{2}, \ldots, G_{n}$ are connected edge-disjoint subgraphs of $G$ with $\mathrm{E}(\mathrm{G})=\mathrm{E}\left(\mathrm{G}_{1}\right) \cup \mathrm{E}\left(\mathrm{G}_{2}\right) \cup \ldots \cup \mathrm{E}\left(\mathrm{G}_{\mathrm{n}}\right)$, then $\left\{G_{1}, G_{2}, \ldots, G_{n}\right\}$ is said to be a Decomposition of $G$. Different type of decomposition of $G$ have been studied in the literature by imposing suitable conditions on the subgraphs $\mathrm{G}_{\mathrm{i}}$. In this paper, we investigate the necessary and sufficient condition for a Complete tripartite graph $\mathrm{K}_{2,4, \mathrm{~m}}$ and a Special Butterfly graph to accept a new type of decomposition called Power of 2 Decomposition. Terms not defined here are used in the sense of Harary [2] .

Definition 1.1. Let $G$ be a simple graph of order $p$ and size $q$. If $G_{1}, G_{2}, \ldots, G_{n}$ are edge-disjoint subgraphs of $G$ such that $\mathrm{E}(\mathrm{G})=\mathrm{E}\left(\mathrm{G}_{1}\right) \cup \mathrm{E}\left(\mathrm{G}_{2}\right) \cup \ldots \cup \mathrm{E}\left(\mathrm{G}_{\mathrm{n}}\right)$, then $\left\{\mathrm{G}_{1}, \mathrm{G}_{2}, \ldots, \mathrm{G}_{\mathrm{n}}\right\}$ is said to be a Decomposition of $G$.

## II. POWER OF 2 DECOMPOSITION OF GRAPHS

Definition 2.1. A graph $G$ is said to have Power of 2 Decomposition [Po2D] , if G can be decomposed into n subgraphs $\left\{G_{1}, G_{2}, \ldots, G_{n}\right\}$ such that each $G_{i}$ is connected and $\left|\mathrm{E}\left(\mathrm{G}_{\mathrm{i}}\right)\right|=2^{\mathrm{i}}$, for $1 \leq \mathrm{i} \leq \mathrm{n}$. Clearly $\mathrm{q}=2\left[2^{\mathrm{n}}-1\right]$ is the sum of $2,2^{2}, 2^{3}, \ldots, 2^{\text {n }}$. Thus, we denote the Power of 2 Decomposition as $\left\{\mathrm{G}_{2}, \mathrm{G}_{4}, \ldots, \mathrm{G}_{2}{ }^{\mathrm{n}}\right\}$.
Example 2.2. Consider the graph.

$K_{1,2,4}$ [ (4,3) - Fan graph]
Complete tripartite graph $\mathrm{K}_{1,2,4}$ admits Power of 2 Decomposition $\left\{G_{2}, G_{4}, G_{8}\right\}$ as follows.

$\mathrm{G}_{2}$
$\mathrm{G}_{4}$

$\mathrm{G}_{8}$

Theorem 2.3. A graph $G$ admits Power of 2 Decomposition [Po2D] $\left\{G_{2}, G_{4}, \ldots, G_{2}{ }^{\mathrm{n}}\right\}$ if and only if $q=2\left[2^{\mathrm{n}}-1\right]$ for each $\mathrm{n} \in \mathrm{N}$.

## III. POWER OF 2 DECOMPOSITION OF $K_{2,4, \mathrm{~m}}$

Definition 3.1. A Complete tripartite graph is a tripartite graph whose vertices are decomposed into three disjoint sets such that no two vertices with in the same set are adjacent but every pair of vertices in the three sets are adjacent. A Complete tripartite graph is denoted as $\mathrm{K}_{\mathrm{a}, \mathrm{b}, \mathrm{c}}$ where a , b and c are three disjoint set of vertices of the graph.
Theorem 3.2. For an odd integer $m, K_{2,4, m}$ has a Power of 2 Decomposition $\left\{G_{2}, G_{4}, \ldots, G_{2^{n}}\right\}$ [n-decompositions] if and only if there exists an integer $n$ satisfying the following properties.

1. $n=2 r+1, r \geq 1$ and $r \in Z$.
2. $2^{n}=5+3 m$

Proof. Let $\mathrm{G}=\mathrm{K}_{2,4, \mathrm{~m}}$. Assume that G has Power of 2
Decomposition $\left\{G_{2}, G_{4}, G_{8}, \ldots, G_{2^{n}}\right\}$. By the definition, $q=2\left[2^{n}-1\right]$, where $n$ denotes the total number of decompositions. By the definition of $G, q=8+6 \mathrm{~m}$. Hence $2\left[2^{n}-1\right]=8+6 m$. This implies $2^{n}=5+3 m$. Since $2^{n}$ is even, $5+3 \mathrm{~m}$ is even. Hence $m$ is odd.
Case 1. n is even .
Then $5+3 \mathrm{~m}$ should be a power value of 4 . This is notpossible for any odd integer $m$. Hence $n$ cannot be even.
Case 2. n is odd.
Clearly $5+3 \mathrm{~m}$ should be written as a power value of 2 , as $5+3 m$ is even. Hence $n$ is odd.
Thus $n=2 r+1, r \geq 1$ and $r \in Z$.
Conversely, assume that $\mathrm{n}=2 \mathrm{r}+1, \mathrm{r} \geq 1$ and $\mathrm{r} \in \mathrm{Z}$. Also, $2^{\mathrm{n}}=5$ +3 m . Hence m is odd. By the definition of $\mathrm{G}, \quad \mathrm{q}=8+$ 6m. This implies q $8+6\left[\frac{2^{n}-5}{3}\right]=8+2\left[2^{n}-5\right]=2\left[2^{n}-1\right]$.
Since $\mathrm{q}=2\left[2^{\mathrm{n}}-1\right]$, G can be decomposed into $\left\{G_{2}, G_{4}, \ldots, G_{2^{n}}\right\}$. Hence $G$ admit Power of 2
Decomposition.

Illustration 3.3. As an illustration, let us decompose the
Complete tripartite graph $\mathrm{K}_{2,4,9}$.
Let $\mathrm{G}=\mathrm{K}_{2,4,9}$. Here $\mathrm{m}=9$. Hence $2^{\mathrm{n}}=32$. Thus $\mathrm{n}=5$. Hence there will be 5 decompositions. The Power of 2
Decomposition of $G$ is $\left\{G_{2}, G_{4}, G_{8}, G_{16}, G_{32}\right\}$ and is given as follows.

Table 3.4. List of first $10 \mathrm{~K}_{2,4, \mathrm{~m}}$ 's which accept Power of 2 Decomposition and their decompositions are given in the following table.

| $m$ | Power of 2 <br> Decompositions |
| :--- | :--- |
| 1 | $\mathrm{G}_{2}, \ldots, \mathrm{G}_{8}$ |
| 9 | $\mathrm{G}_{2}, \ldots, \mathrm{G}_{32}$ |
| 41 | $\mathrm{G}_{2}, \ldots, \mathrm{G}_{128}$ |
| 169 | $\mathrm{G}_{2}, \ldots, \mathrm{G}_{512}$ |
| 681 | $\mathrm{G}_{2}, \ldots, \mathrm{G}_{2048}$ |
| 2729 | $\mathrm{G}_{2}, \ldots, \mathrm{G}_{8192}$ |
| 10,921 | $\mathrm{G}_{2}, \ldots, \mathrm{G}_{32768}$ |
| 43,689 | $\mathrm{G}_{2}, \ldots, \mathrm{G}_{131072}$ |
| 174,761 | $\mathrm{G}_{2}, \ldots, \mathrm{G}_{524288}$ |
| 699,049 | $\mathrm{G}_{2}, \ldots, \mathrm{G}_{2097152}$ |

## IV. POWER OF 2 DECOMPOSITION OF SPECIAL BUTTERFLY GRAPH

Definition [5] 4.1. Consider the cycle $\mathrm{C}_{2 \mathrm{t}+2, \mathrm{t}} \geq 4$. Let $\mathrm{a}_{0}, \mathrm{a}_{1} \mathrm{a}_{2}$, $\ldots, \mathrm{a}_{2 \mathrm{t}+1}$ be the vertices of the cycle $\mathrm{C}_{2 t+2}$. Join $\mathrm{a}_{0}$ and $\mathrm{a}_{2 \mathrm{i}-1,2} 2 \leq$ $\mathrm{i} \leq \mathrm{t}$. Attach two pendant edges at $\mathrm{a}_{\mathrm{t}}$ and $\mathrm{a}_{\mathrm{t}+2}$. Let the vertices attached with those edges be $a_{2 t+2}, a_{2 t+3}$ respectively. This is called the Special Butterfly Graph and it is denoted by $\mathrm{BF}_{\mathrm{t}}$. The graph $\mathrm{BF}_{\mathrm{t}}$ has $2 \mathrm{t}+4$ vertices and $3 \mathrm{t}+3$ edges.
Theorem 4.2. A Special Butterfly Graph $B F_{\left[\frac{2^{2 m+1}-5}{3}\right]}$ admit Power of 2 Decomposition $\left\{G_{2}, G_{4}, \ldots, G_{2^{n}}\right\}$ if and only if $\mathrm{n}=2 \mathrm{~m}, \mathrm{~m} \in \mathrm{~N}$.
Proof. Assume that $G=B F_{\left[\frac{2^{2 m+1}-5}{3}\right]}$ admit Power of 2
Decomposition $\left\{G_{2}, G_{4}, \ldots, G_{2^{n}}\right\}$. By the definition of $G$,
$\mathrm{q}=3\left[\frac{2^{2 m+1}-5}{3}\right]+3=2^{2 m+1}-2$. Since $G$ admit Power of
2 Decomposition, $q=2\left[2^{n}-1\right]$. Hence $2^{2 m+1}-2=2\left[2^{n}-1\right]$.
This implies $n=2 m$.
Conversely, assume that $\mathrm{n}=2 \mathrm{~m}, \mathrm{~m} \in \mathrm{~N}$. Let $\mathrm{G}=B F_{\left[\frac{2^{2 m+1}-5}{3}\right]}$. Then $\mathrm{q}(\mathrm{G})=2^{2 \mathrm{~m}+1}-2$. This implies $q=2\left[2^{n}-1\right]$. Decompose the edges of $G$ as follows:
$\mathrm{G}_{2}=\mathrm{a}_{\mathrm{t}+2} \mathrm{a}_{\mathrm{t}+3} \cup \mathrm{a}_{\mathrm{t}+3} \mathrm{a}_{\mathrm{t}+4}$,
$\mathrm{G}_{4}=\mathrm{a}_{2 \mathrm{t}+2} \mathrm{a}_{\mathrm{t}} \cup \mathrm{a}_{\mathrm{t}} \mathrm{a}_{\mathrm{t}+1} \cup \mathrm{a}_{\mathrm{t}+1} \mathrm{a}_{\mathrm{t}+2} \cup \mathrm{a}_{\mathrm{t}+2} \mathrm{a}_{2 \mathrm{t}+3}$,
$\mathrm{G}_{8}, \mathrm{G}_{32}, \ldots, G_{2^{n-1}}=\cup \mathrm{a}_{0} \mathrm{a}_{2 \mathrm{i}-1}, \quad 2 \leq \mathrm{i} \leq \mathrm{t} \quad$ and
$\mathrm{G}_{16}, \mathrm{G}_{64}, \ldots, G_{2^{n}}=\mathrm{a}_{0} \mathrm{a}_{2 \mathrm{t}+1} \cup \mathrm{a}_{\mathrm{i}-1} \mathrm{a}_{\mathrm{i}}, 1 \leq \mathrm{i} \leq \mathrm{t}$ and
$\mathrm{t}+5 \leq \mathrm{i} \leq 2 \mathrm{t}+1$
Thus G can be decomposed using Power of 2 Decomposition.
Illustration 4.3. As an illustration, let us decompose the Special Butterfly Graph $\mathrm{BF}_{9}$.

## V. CONCLUSION

Thus we had investigated the properties of two special graphs to accept a new type of graph decomposition called Power of 2 Decomposition.Also we can extend the study to various types of special graphs.
