# On Equitable Irregular graphs

P. Sanakara Narayanan, S. Saravanakumar

Abstract: An k-edge-weighting of a graph G = (V,E) is a map  $\varphi: E(G) \to \{1,2,3,\ldots k\}$ , where  $k \ge 1$  is an integer. Denote  $S_{\varphi}(v)$  is the sum of edge-weights appearing on the edges incident at the vertex v under $\varphi$ . An k-edge -weighting of G is equitable irregular if  $|S_{\varphi}(u) - S_{\varphi}(v)| \le 1$ , for every pair of adjacent vertices u and v in G. The equitable irregular strength  $S_e(G)$  of an equitable irregular graph G is the smallest positive integer k such that there is a k-edge weighting of G. In this paper, we discuss the equitable irregular edge-weighting for some classes of graphs.

Keywords : Edge-weighting, equitable irregular graphs.

# I. INTRODUCTION

A graph labeling is an assignment of integers to the vertices or edges or both with respect to some conditions. A detailed survey of graph labeling is given by Gallian [4]. This paper considering an edge labeling of graphs. For our convenience, we call the term edge - weighting instead of edge - labeling. An k-edge weighting is a map  $\varphi : E(G) \rightarrow \{1, 2, \dots, k\},\$ where  $k \in NN$  is equitable irregular if  $|S_{\varphi}(u) - S_{\varphi}(v)| \leq$ 1 for every pair of adjacent vertices u and v in G, where  $S_{\varphi}(x)$  is the sum of the edge - weights presenting on the edges incident at the vertex x. A graph admits such a labeling is called an equitable irregular. This notion was introduced by I. Sahul Hamid and S. Ashok Kumar in [3]. In that paper, the authors were discussed some properties of equitable irregular graphs and provided some classes of equitable irregular graphs along with its strength. In this paper, we extend the study of this parameter by proving closed helm graphs, windmill graphs, flower graphs, quadrilateral snake and double quadrilateral snake graphs are equitable irregular. Moreover, we determine the exact value of the strength for each of these classes of graphs. For this, we need the following theorem which is proved in [3].

**Theorem 1.1.** If G is equitable irregular graph, then  $S_e(G) \ge \left[\frac{\Delta(G)-2}{\mu(G)-1}\right]$ , where  $\mu(G) = \min\{\mu_x : x \in V(G)\}$ , deg  $x = \Delta(G)$  and  $\mu(x) = \min\{\deg y : xy \in E(G)\}$ .

### **II. MAIN RESULTS**

In this section, we prove that the closed helm graphs, windmill graphs, flower graphs, quadrilateral and double quadrilateral graphs are equitable irregular. Moreover, we compute the irregularity strength of these families.

**Definition 2.1.** A *closed helmCH*<sub>n</sub> is the graph obtained by taking a helm  $H_n$  and adding edges between the pendant vertices to form a cycle.

**Theorem 2.2.** For all *n*, the graph  $CH_n$  is equitable irregular and  $S_e(CH_n) = \left[\frac{n-2}{3}\right]$ .

**Proof.** Let V(  $CH_n$ ) = { $v_0, v_1, v_1', v_2, v_2', ..., v_n, v_n'$ } and  $E(CH_n) = \{v_0v_i: 1 \le i \le n\} \cup \{v_iv_i': 1 \le i \le n\} \cup \{v_iv_{i+1}: 1 \le i \le n-1\} \cup \{v_1v_{i+1}: 1 \le i \le n-1\} \cup \{v_1v_n, v_1'v_n'.$  Define an edge-weighting  $\varphi$  of  $CH_n$  as follows.

Let  $\varphi(v_0 v_i) = 1$  for all  $1 \le i \le n$  and assign  $\left[\frac{n-2}{3}\right]$  for all the remaining edges of  $CH_n$ . (For the graph  $CH_n$ , the edge-weighting  $\varphi$  is illustrated in Figure 1).

Then  $S_{\varphi}(v_0) = n$  and for all  $1 \le i \le n$ , we have  $S_{\varphi}(v_0) = \varphi(v_0v_i) + \varphi(v_iv_i') + \varphi(v_iv_{i+1}) + \varphi(v_iv_{i-1})$  $= \begin{cases} n+1 & \text{if } n \equiv 0 \pmod{3} \\ n & \text{if } n \equiv 1 \pmod{3} \\ n-1 & \text{if } n \equiv 2 \pmod{3} \end{cases}$ 

Further,  $S_{\varphi}(v_{i}') = \varphi(v_{i}v_{i}') + \varphi(v_{i}'v_{i+1}') + \varphi(v_{i}'v_{i-1}')$  $= \begin{cases} n & if \ n \equiv 0(mod3) \\ n-1 & if \ n \equiv 1(mod3) \\ n-2 & if \ n \equiv 2(mod3) \end{cases}$ It is clear that the difference of the weights of any two

It is clear that, the difference of the weights of any two adjacent vertices of  $CH_n$  under  $\varphi$  is at most 1. Hence  $CH_n$  is equitable irregular and so  $S_e(CH_n) \leq \left[\frac{n-2}{3}\right]$ . Since  $\mu(CH_n) = 4$  and  $\Delta(CH_n) = n$ , it follows by Theorem 1.1, we get  $S_e(CH_n) \geq \left[\frac{n-2}{3}\right]$ . Thus  $S_e(CH_n) = \left[\frac{n-2}{3}\right]$ .

**Definition 2.3**. The *windmill graph*  $W_n^{(m)}$  is the graph obtained by taking *m*-copies of the complete graph  $K_n$  with a vertex in common.

**Theorem 2.4.** For all *n* and *m*, the windmill graph $W_n^{(m)}$  is equitable irregular.

**Proof:**Let  $V(W_n^{(m)}) = \{v_0, v_{11}, v_{12}, v_{13}, \dots, v_{1(n-1)}, v_{21}, v_{22}, v_{23}, \dots, v_{2(n-1)}, \dots, v_{m1}, v_{m2}, v_{m3}, \dots, v_{m(n-1)}\}$ and  $E(W_n^{(m)}) = \{E(G_i) : 1 \le i \le m\} \cup \{v_0 v_{ij} : 1 \le i \le n, 1 \le j \le n-1\},$ 

 $V(G_i) = \{v_{i1}, v_{i2}, v_{i3}, \dots, v_{i(n-1)}: 1 \le i \le m\}.$ 

122

We now assign the weights to the edges of  $W_n^{(m)}$  as follows. Let  $\varphi(v_0 v_{ij}) = 1$  for all i = 1,2,3...m and j = 1,2,3,...,n-1. Further assign the weights  $\left[\frac{mn-m-2}{n-2}\right]$  to all the remaining edges of  $W_n^{(m)}$ . (For the graph  $W_4^{(3)}$  the edges-weighting  $\varphi$  is illustrated in Figure 2). Then edge weighting of  $W_n^{(m)}$  as follows.

For all 
$$1 \le i \le m$$
 and  $1 \le i \le n-1$ , we have  $S_{\varphi}(v_{ij}) = 1 + (n-2) \left[\frac{mn-m-2}{n-2}\right]$  and  $S_{\varphi}(v_0) = m(n-1)$ ,

$$S_{\varphi}(v_{nm}) = \begin{cases} m(n-1)+1 & \text{if } n, m \text{ are odd} \\ m(n-1) & \text{if } m \text{ is odd}, n \text{ is even} \\ m(n-1)-1 & \text{otherwise} \end{cases}$$

Clearly for any two adjacent vertices of  $W_n^{(m)}$ , their weights are differ by at most one and hence  $W_n^{(m)}$  is equitable irregular. Thus  $S_e(W_n^{(m)}) \leq \left[\frac{mn-m-2}{n-2}\right]$ .

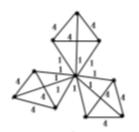

Figure 2: The graph  $W_4^{(3)}$  and its irregualr edge weighting

Since  $\Delta(W_n^{(m)}) = (n-1)m$  and  $\mu(W_n^{(m)}) = n-1$ , it follows from Theorem 1.1 we get  $S_e(W_n^{(m)}) \ge \left[\frac{mn-m-2}{n-2}\right]$ . Thus  $S_e(W_n^{(m)}) = \left[\frac{mn-m-2}{n-2}\right]$ .

**Definition 2.5**. A *flower*  $graphFl_n$  is the graph obtained from a closed helm by joining each pendant vertex of the helm toits center vertex.

**Theorem 2.6.** The flower graph  $Fl_n$  is equitable irregular for all *n* and  $S_e(Fl_n) = \left\lfloor \frac{2n}{3} \right\rfloor$ .

**Proof:** Let  $V(Fl_n) = \{v_0, v_1, v_1', v_2, v_2', ..., v_n, v_n'\}$  and  $E(Fl_n) = \{v_0v_i: 1 \le i \le n\} \cup \{v_iv_i': 1 \le i \le n\} \cup \{v_iv_{i+1}: 1 \le i \le n-1\} \cup \{v_iv_{i+1}: 1 \le i \le n-1\} \cup \{v_0v_i: 1 \le i \le n\} \cup \{v_1v_n, v_1'v_0\}.$ 

Now, let us define an edge-weighting  $\varphi$  of  $Fl_n$  as follows. For all  $1 \le i \le n$ , let  $\varphi(v_0v_i) = \varphi(v_0v_i') = 1$  and assign  $\left\lfloor \frac{2n}{3} \right\rfloor$  to all remaining edges of  $Fl_n$ . Then  $S_{\varphi}(v_0) = 2n$  and for all  $1 \le i \le n$ , we have

$$S_{\varphi}(v_{i}) = S_{\varphi}(v_{i}') = = \begin{cases} 2n & \text{if } n \equiv 2(mod3) \\ 2n+1 & \text{if } n \equiv 0(mod3) \\ 2n-1 & \text{if } n \equiv 1(mod3) \end{cases}$$

One can easily verify that the difference of the weights of any two adjacent vertices of  $Fl_n$  is at most 1 and hence  $Fl_n$  is equitable irregular. Thus  $S_e(Fl_n) \leq \left\lfloor \frac{2n}{3} \right\rfloor$ . Here  $\mu(Fl_n) = 4$  and  $\Delta(Fl_n) = 2n$ , we get  $S_e(Fl_n) \geq \left\lfloor \frac{2n}{3} \right\rfloor$  by Theorem1.1. Hence  $S_e(Fl_n) = \left\lfloor \frac{2n}{3} \right\rfloor$ .

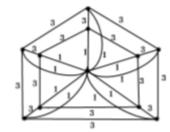

Figure 3: The graph  $Fl_5$  and its irregular edge weighting

**Definition 2.7.** The *Lotus inside a circle*  $LC_n$  is a graph obtained from the cycle  $C_n:(u_1, u_2, ..., u_m, u_1)$  and star  $K_{1,n}$  with center vertex  $v_0$  and end vertices  $v_1, v_2, ..., v_n$  by joining each  $v_i$  to  $u_i$  and  $u_{i+1}$  (modn).

**Theorem 2.8**. The Lotus inside a circle graph  $LC_n$  is equitable irregular for all n and  $S_e((LC_n) = \left\lfloor \frac{n-1}{2} \right\rfloor$ . **Proof**: Let  $V(LC_n) = \{v_0, v_1, u_1, v_2, u_2, \dots, v_n, u_n\}$  and  $E(LC_n) = \{v_0v_i: 1 \le i \le n\} \cup \{v_iu_i: 1 \le i \le n\} \cup \{v_iu_{i+1}: 1 \le i \le n-1\} \cup \{v_nu_1\} \cup \{u_iu_{i+1}: 1 \le i \le n-1\} \cup \{v_nu_1\} \cup \{u_iu_{i+1}: 1 \le i \le n-1\} \cup \{u_nu_n\}$ .

Now, let us define an edge-weighting  $\varphi$  of  $LC_n$  as follows.  $\varphi(v_0v_i) = \varphi(u_iu_{i+1}) = \varphi(u_1u_n) = 1$  for all  $1 \le i \le n$  and assign  $\left\lfloor \frac{n-1}{2} \right\rfloor$  to all the remaining edges of  $LC_n$ . (For the graph  $LC_5$ , the equitable irregular edge-weighting  $\varphi$  is illustrated in Figure 4.) Clearly,  $S_{\varphi}(v_0) = S_{\varphi}(u_n) = n$  and

$$S_{\varphi}(v_0) = S_{\varphi}(u_n) = n$$
 and  
 $S_{\varphi}(v_n) = \begin{cases} n & \text{if } n \text{ is odd} \\ n-1 & \text{if } n \text{ is even} \end{cases}$ 

It is easy to observe that the weights of any two adjacent vertices of  $LC_n$  are differ by at most 1. Thus  $LC_n$  is equitable irregular.

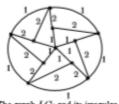

Figure 4: The graph  $LC_5$  and its irregular edge weighting

Also,  $\mu(LC_n) = 3$  and  $\Delta(LC_n) = n$ , by Theorem 1.1 that  $S_e(LC_n) \ge \left\lfloor \frac{n-1}{2} \right\rfloor$  and the edge-weighting  $\varphi$  deduces that  $S_e(LC_n) \le \left\lfloor \frac{n-1}{2} \right\rfloor$ . Hence  $S_e(LC_n) = \left\lfloor \frac{n-1}{2} \right\rfloor$ 

**Definition 2.9.** A *quadrilateral snakeQ<sub>n</sub>* is obtained from a path  $u_1, u_2, ..., u_m$  by joining  $u_i$  and  $u_{i+1}$  to new vertices  $v_i$  and  $w_i$  respectively and joining the vertices  $v_i$  and  $w_i$  for i = 1, 2, ..., n - 1.

**Theorem 2.10.** The Quadrilateral snake  $Q_n$  is equitable irregular for all *n* and  $S_e(Q_n) = 2$ .

**Proof :**Let V  $(Q_n) = \{u_1, u_2, u_3, ..., u_{n+1}\} \cup \{v_i w_i : 1 \le i \le n-1\}$  and  $E(Q_n) = \{u_i u_{i+1} : 1 \le i \le n\} \cup \{u_i v_i, v_i w_i, w_i u_{i+1} : 1 \le i \le n-1\}$ . Define an edge weighting  $\varphi$  of  $Q_n$  as follows.

Let  $\varphi(u_i u_{i+1}) = \varphi(w_i u_{i+1}) = 1$  and  $\varphi(u_i v_i) = 1$  for all  $2 \le i \le n - 1$  and assign the label 2 to all the remaining edges of  $Q_n$ . Then the weight of any vertex of  $Q_n$  is either 3 or 4.

Blue Eyes Intelligence Engineering 423 & Sciences Publication

Published By:

Therefore, the weights of any two adjacent vertices of  $Q_n$  differ by at most 1 and so  $Q_n$  is equitable irregular. (For the graph  $Q_3$ , the equitable irregular edge-weighting  $\varphi$  is illustrated in Figure 5). Hence  $S_e(Q_n) \leq 2$ .

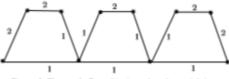

Figure 5: The graph  $Q_3$  and its irregular edge weighting

Since  $\mu(Q_n) = 2$  and  $\Delta(Q_n) = 4$ , it follows by Theorem 1.1,  $S_e(Q_n) \ge 2$ . Thus  $S_e(Q_n) = 2$ .

**Definition 2.11.** A *Double Quadrilateral snake*  $DQ_n$  is a graph consists of two quadrilateral snakes that have a common path.

**Theorem 2.12**. The Double Quadrilateral snake  $DQ_n$  is equitable irregular for all *n* and  $S_e(DQ_n) = 4$ .

**Proof.** Let V  $(DQ_n) = \{u_1, u_2, u_3, ..., u_{n+1}\} \cup$ 

 $\{v_i, w_i, x_i, y_i : 1 \le i \le n\} \text{and}$ E $= \{u_i u_{i+1}, u_i v_i, v_i w_i, w_i u_{i+1}, u_i x_i, x_i y_i, y_i u_{i+1}: 1 \le i \le n\}$ 

 $= \{u_i u_{i+1}, u_i v_i, v_i w_i, w_i u_{i+1}, u_i x_i, x_i y_i, y_i u_{i+1}: 1 \le t \le n\}.$ 

Now, let us define an edge weighting  $\varphi$  of  $DQ_n$  as follows. Let  $\varphi(u_1v_1) = \varphi(u_1x_1) = \varphi(u_{n+1}w_n) = \varphi(u_{n+1}y_n) = 2$  and  $\varphi(v_iw_i) = \varphi(x_iy_i) = 4$  for all  $1 \le i \le n$ .

Further, assign the label 1 to all the remaining edges of  $DQ_n$ . Then  $S_{\varphi}(u_1) = S_{\varphi}(u_{n+1}) = 5$ ;  $S_{\varphi}(v_1) = S_{\varphi}(x_1) = S_{\varphi}(w_n) = S_{\varphi}(y_n) = 6$  and for all  $1 \le i \le n - 1$ , we have  $S_{\varphi}(y_i) = S_{\varphi}(w_i) = 5$  and for all  $2 \le i \le n$ ,  $S_{\varphi}(u_i) = 6$ .

Clearly, the weights of any two adjacent vertices of  $DQ_n$  are differ by atmost 1. Therefore  $DQ_n$  is equitable irregular and hence  $S_e$   $(DQ_n) \le 4$ .

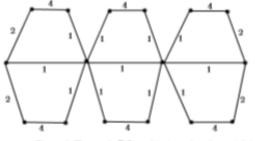

Figure 6: The graph  $DQ_3$  and its irregular edge weighting

Since  $\mu(DQ_n) = 2$  and  $\Delta(DQ_n) = 6$ , this implies  $S_e(DQ_n) \ge 4$ by Theorem 1.1. and thus  $S_e(DQ_n) = 4$ .

# **III. CONCLUSION**

In this paper, wehave proved some special classes of graphs such as closed helm graphs, windmill graphs, flower graphs, quadrilateral snakes and double quadrilateral snakes are equitable irregular.
