

Identification and cross-domain metadata interoperability

Godfrey Rust, Rightscom/RDI/Copyright Hub

New initiatives on interoperability

LCC (Linked Content Coalition)

Consortium of ID and data standards bodies formed to promote interoperability.

EDItEUR, IDF, IPTC, Movielabs, NISO, PLUS Coalition

ISO Identifier agencies expected to join.

RDI (Rights Data Integration project)

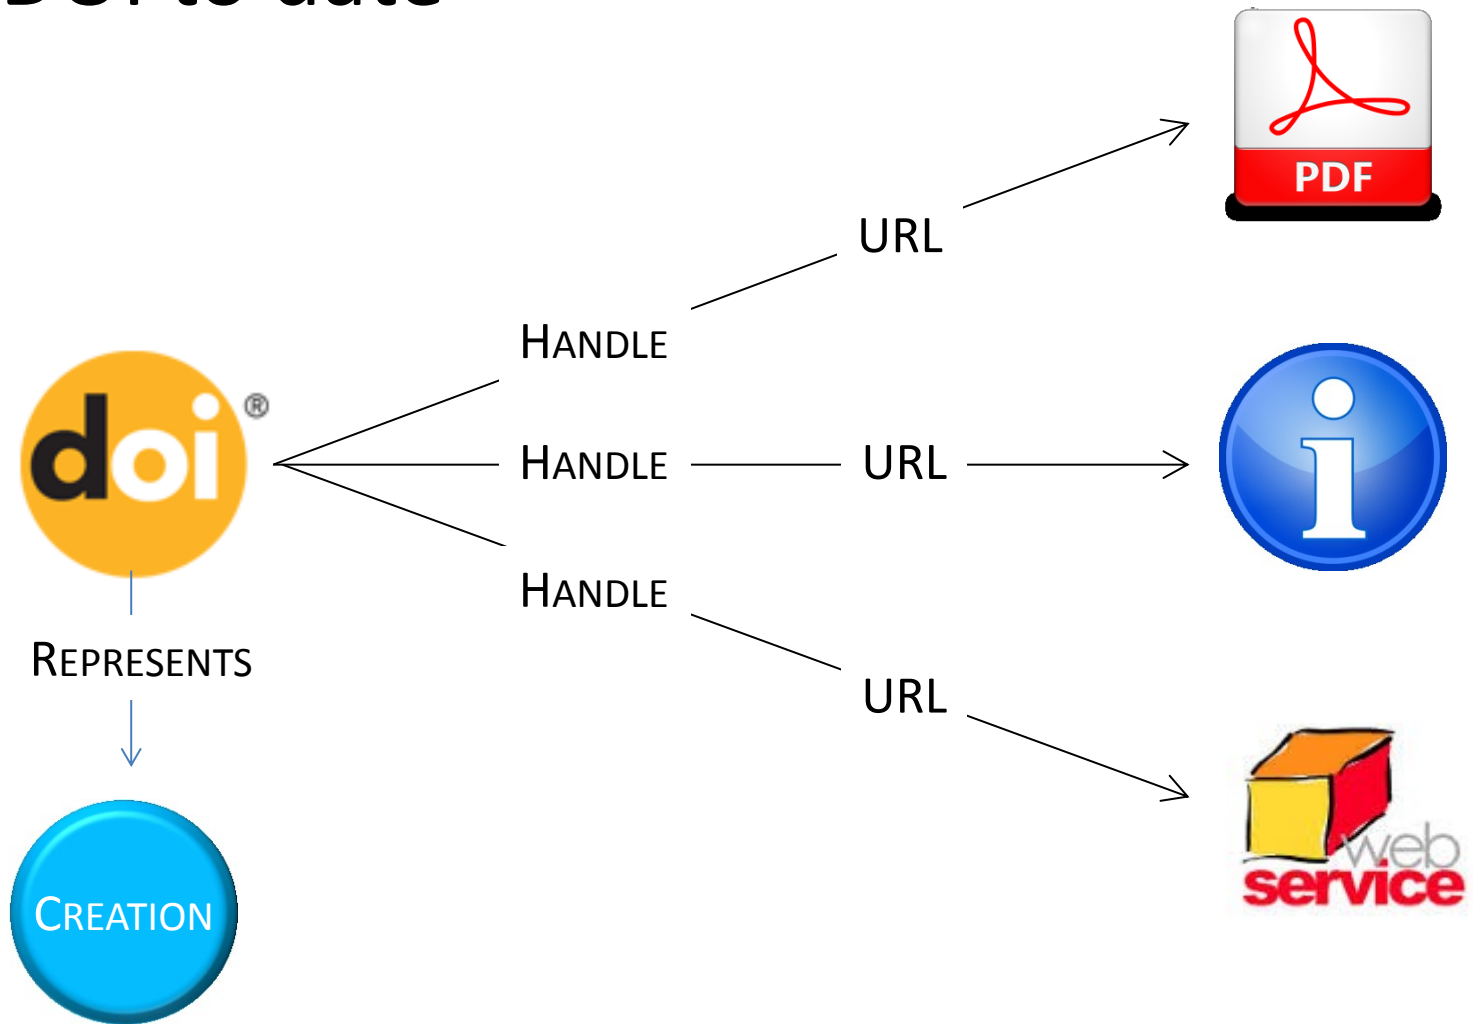

Building prototype implementation of LCC data model for metadata interoperability.

Copyright Hub (with Digital Catapult)

Not-for-profit, permanent initiative to facilitate content licensing (using LCC/RDI and own tech).

DOI to date

A linked identifier network

(Based on LCC data model)

A linked identifier network

“Anything made by human beings in which rights may exist”

A linked identifier network

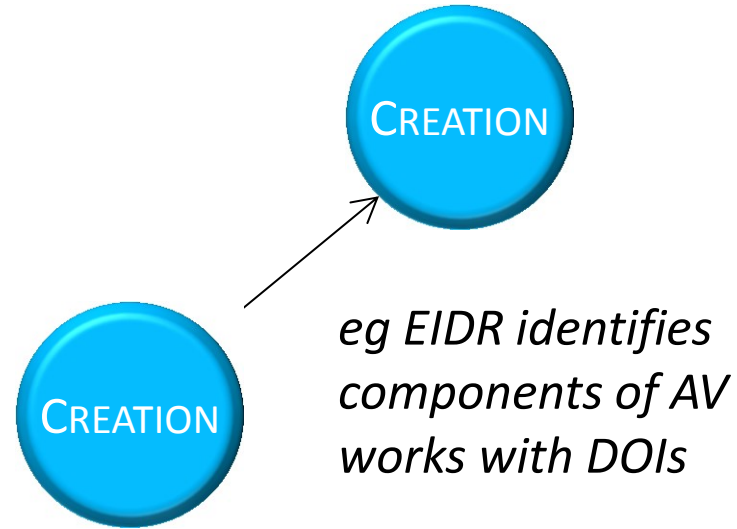

May be physical,
digital or abstract

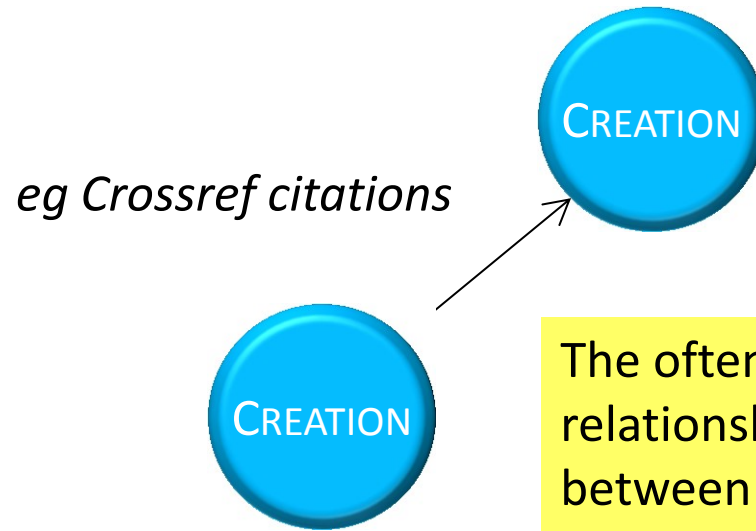

*Most DOIs identify
abstractions, not
digital or physical
manifestations*

A linked identifier network

May have parts or derivations which need to be identifiable to any level of required granularity.

A linked identifier network

The often complex relationship links between Creations are increasingly important in managing and exploiting content.

A linked identifier network

A linked identifier network

A person or organizations

eg EIDR identifies parties with DOIs

A linked identifier network

eg ISNI stores many different Party IDs against one ISNI.

eg EIDR stores many Creation IDs against one DOI.

It's OK to have many IDs for the same thing, as long as they are linked to each other and those links are accessible.

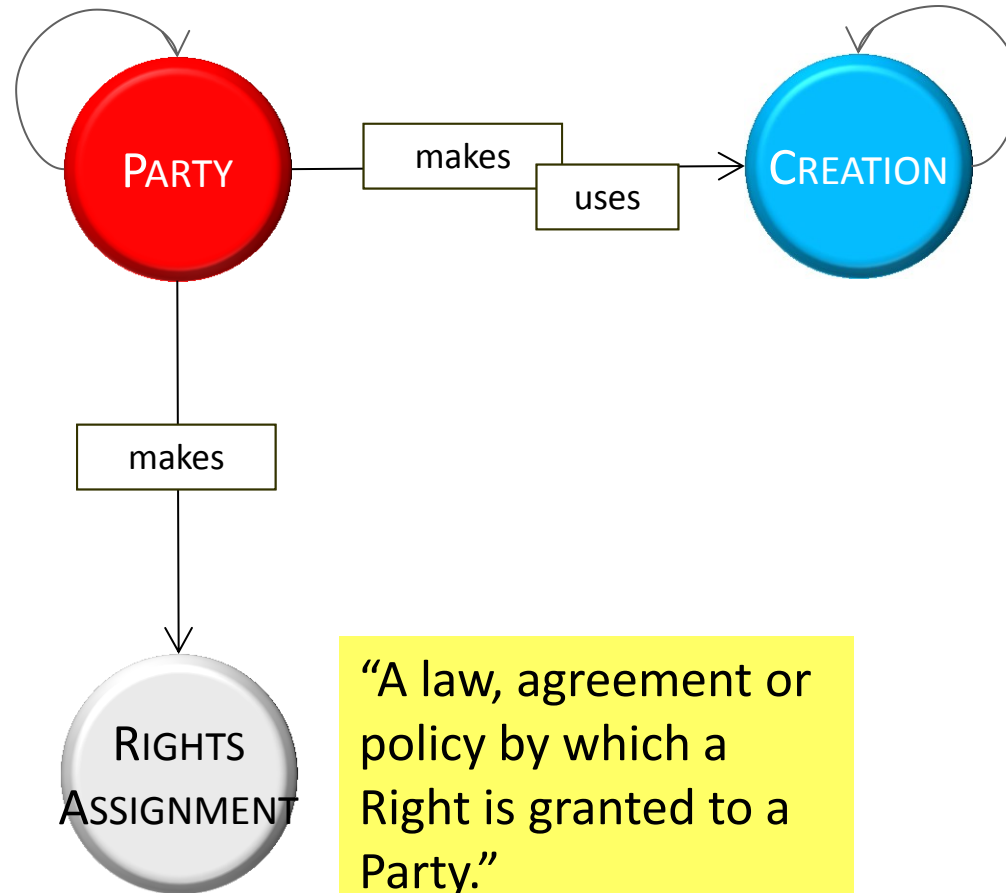

Existing IDs have to be used – we can't "start again".

A linked identifier network

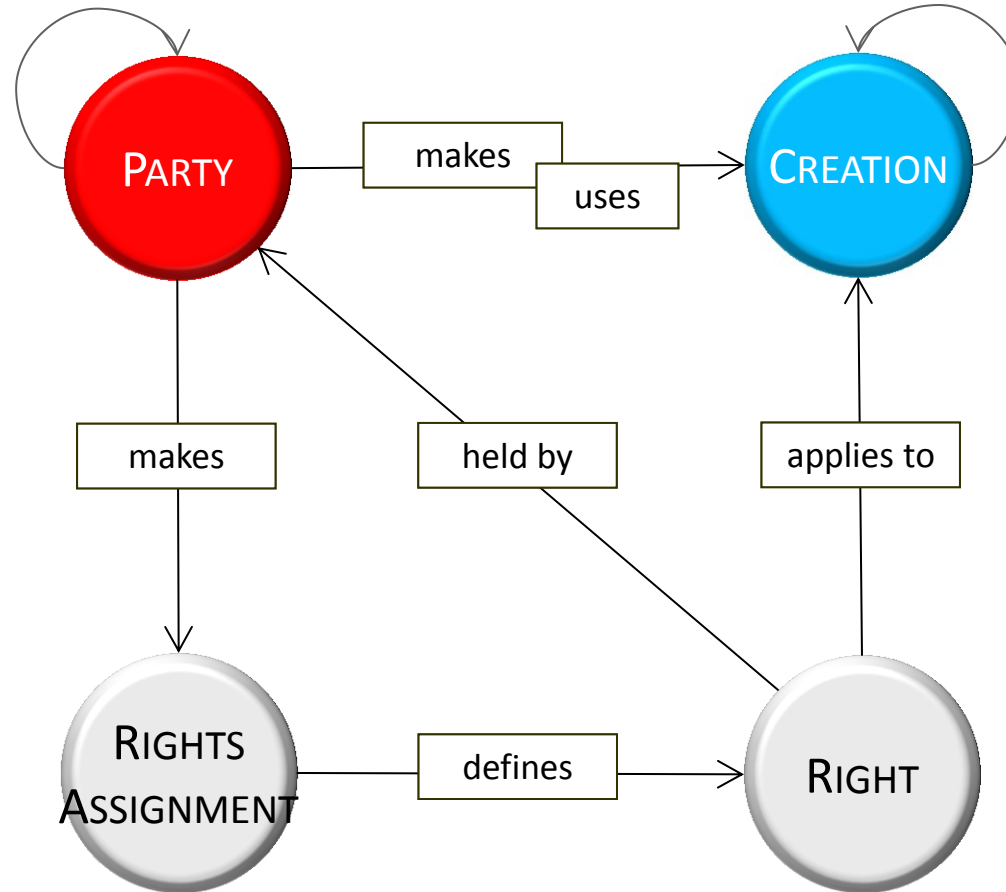

Two other things will need public IDs if the digital content and rights network is going to function well and be highly automated.

A linked identifier network

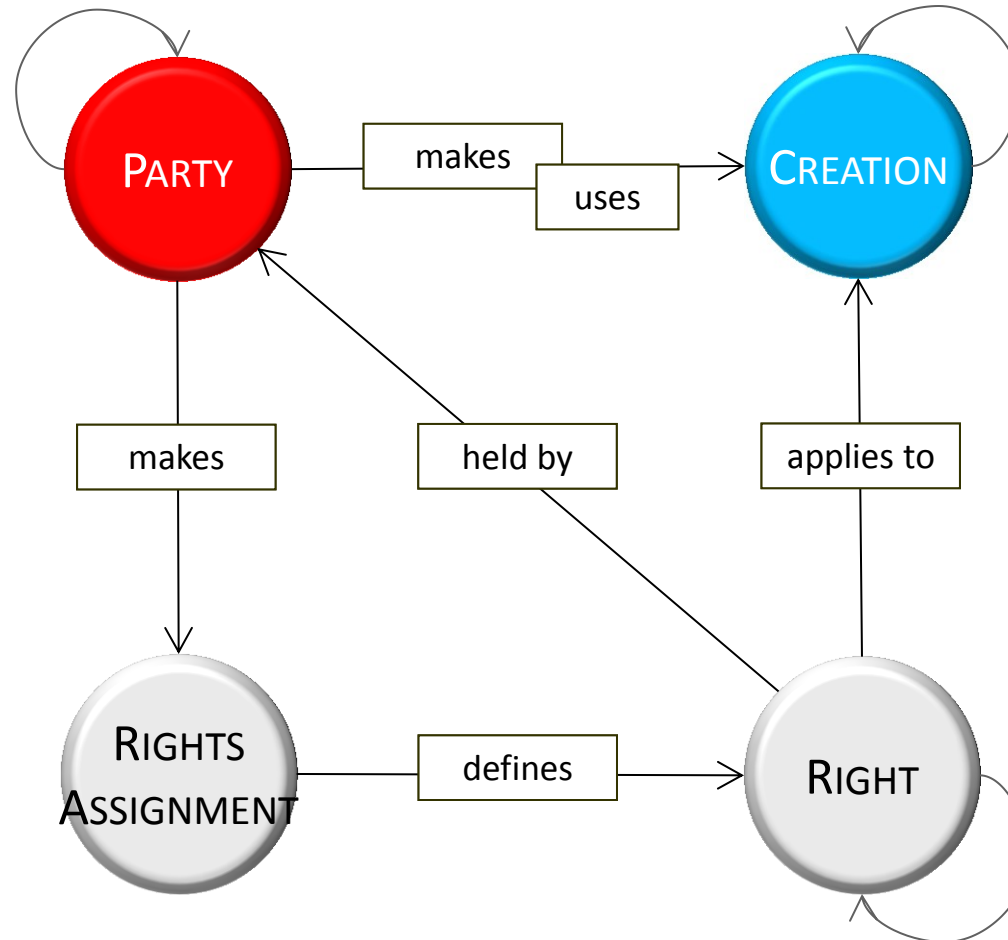

A linked identifier network

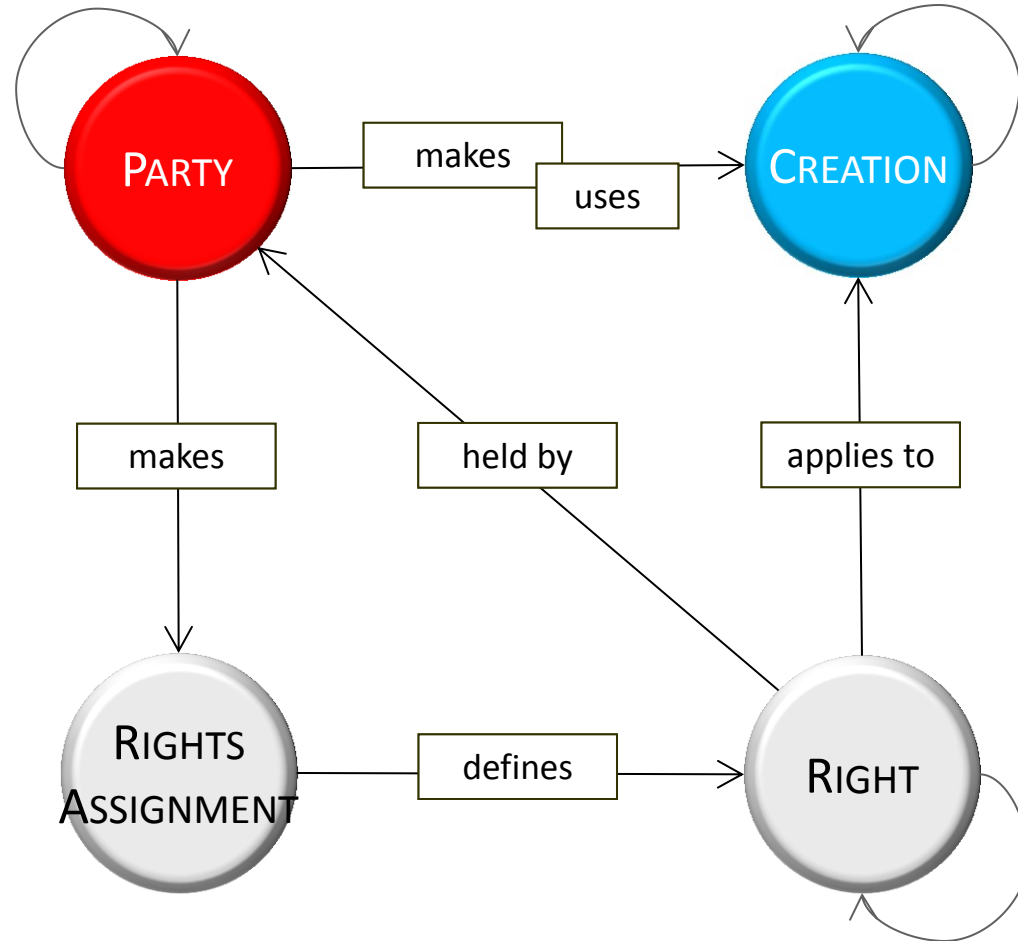

“A state in which a Party is entitled to do something in relation to a Creation”

A linked identifier network

Only when each of these entities is identified, and that ID is resolvable to a URL for some action can content management function really effectively in the digital network.

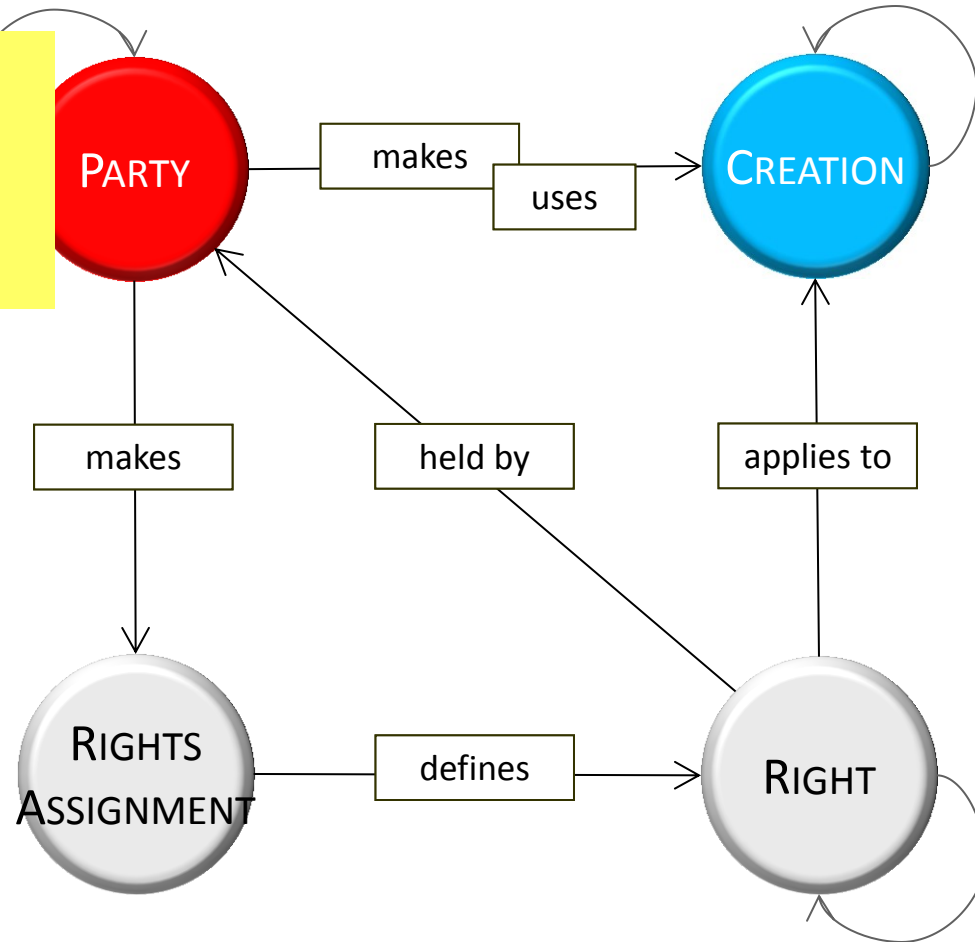

A linked identifier network

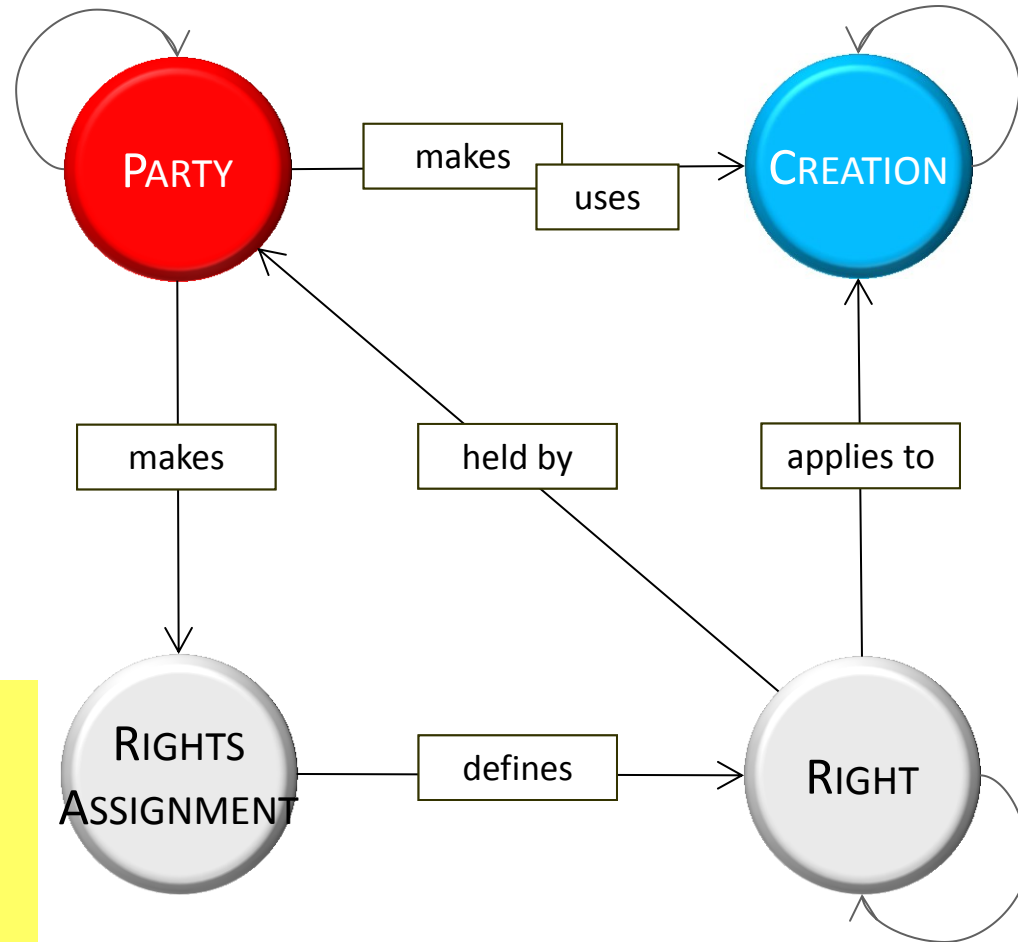

Not bad – some big gaps, and not enough resolution.

A linked identifier network

Getting somewhere at last – ISNI the big hope.

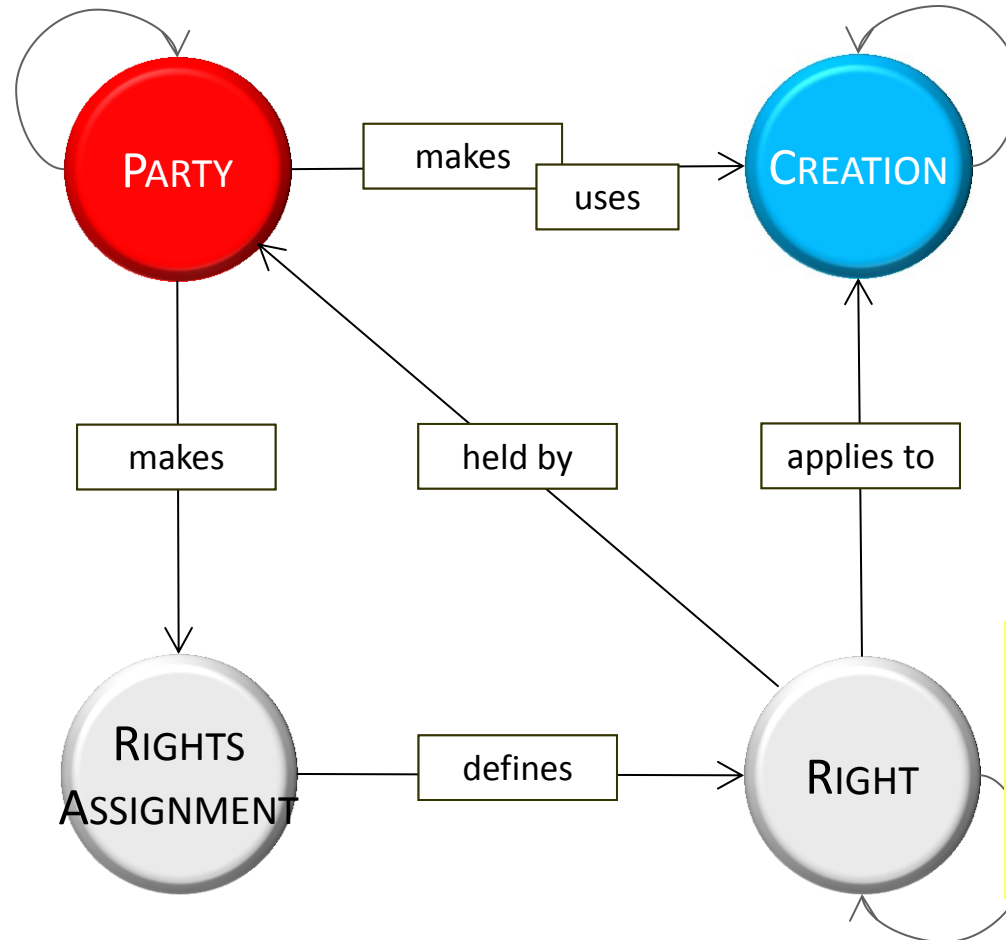

A linked identifier network

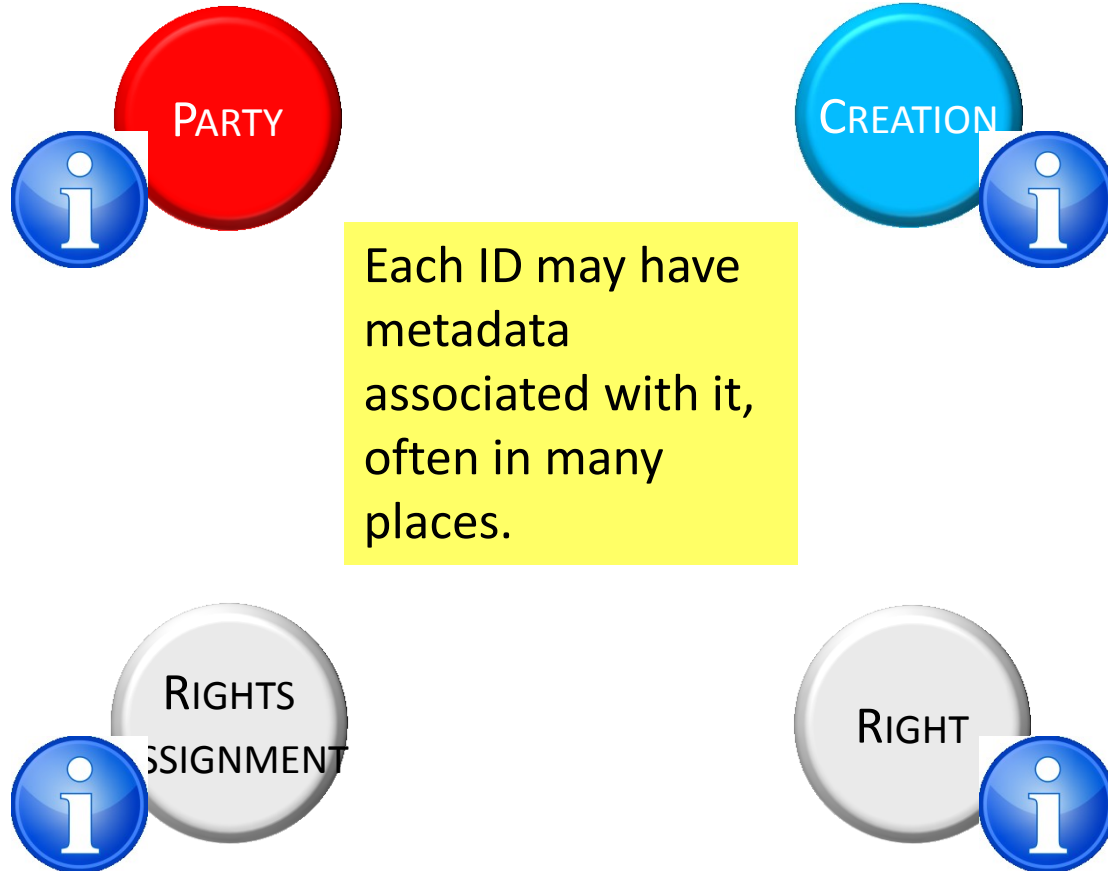

Lots of individual License IDs, but not actionable.

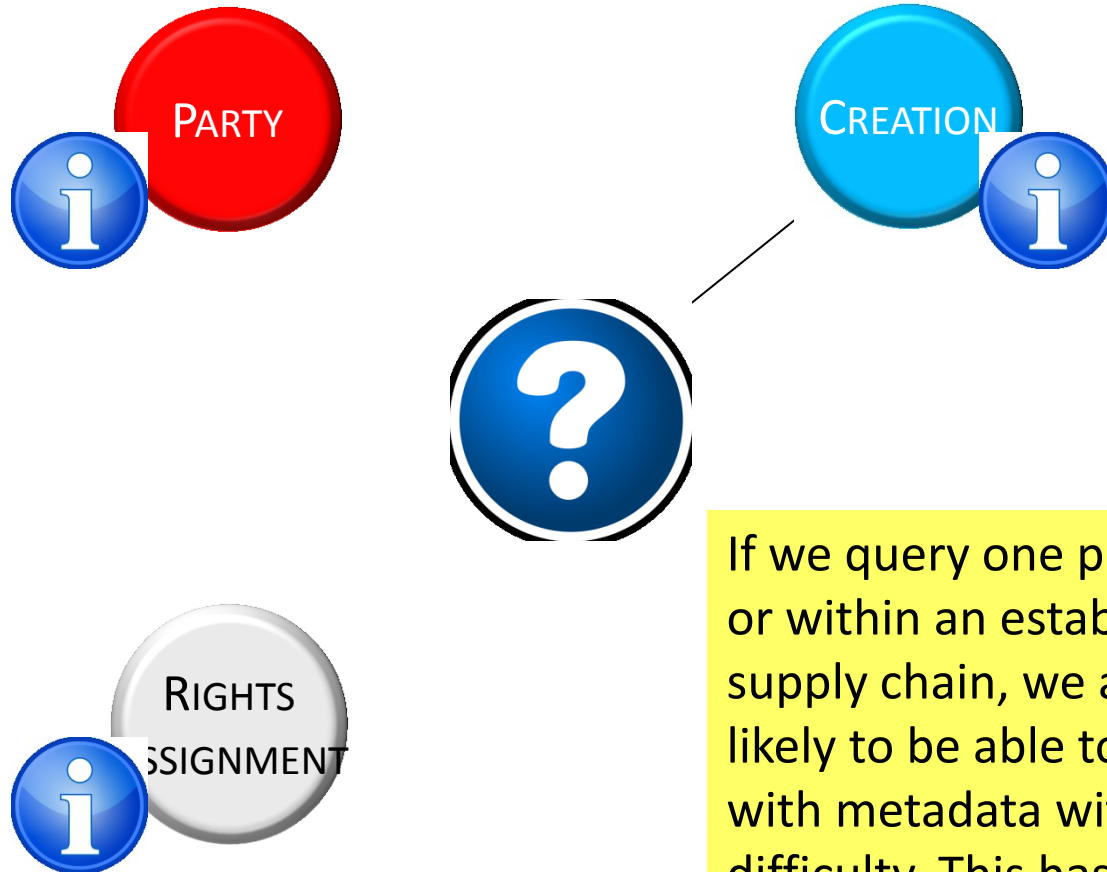

A linked identifier network

Metadata interoperability

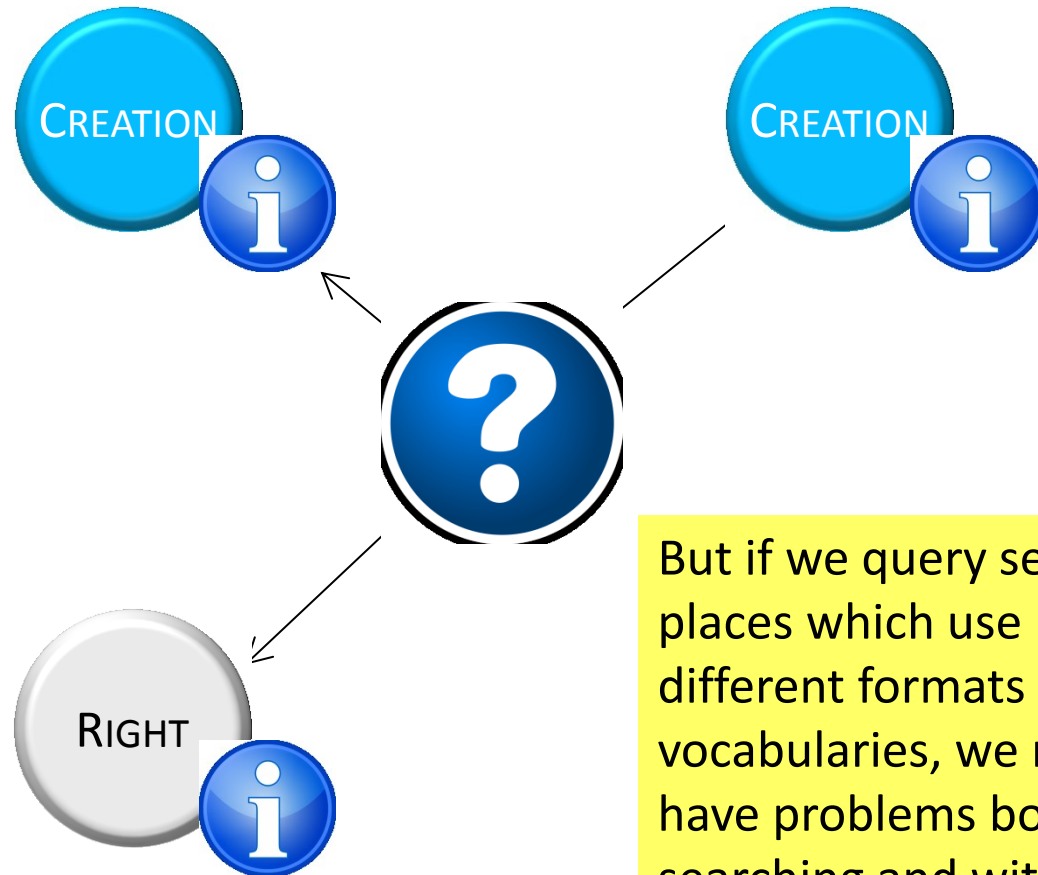

Metadata interoperability

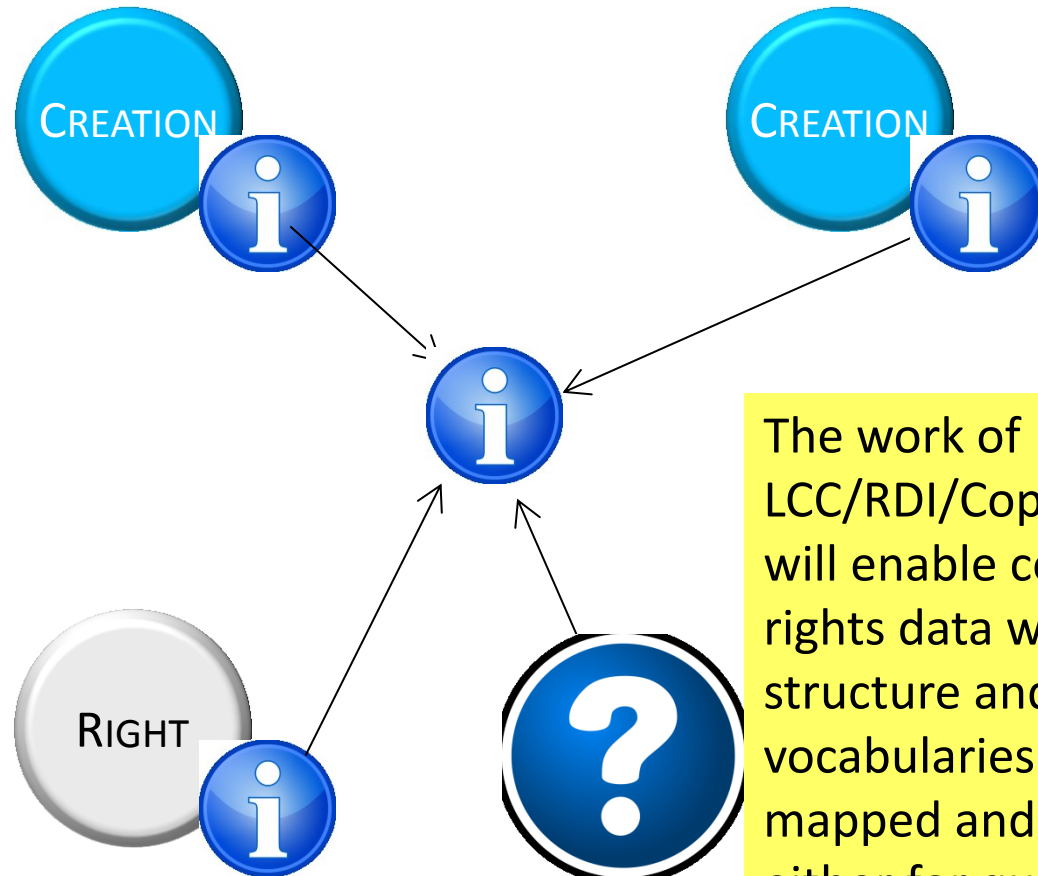

If we query one place, or within an established supply chain, we are likely to be able to deal with metadata without difficulty. This has been DOI RAs experience to date.

Metadata interoperability

But if we query several places which use different formats and vocabularies, we may have problems both with searching and with aggregating the results.

Metadata interoperability

The work of LCC/RDI/Copyright Hub will enable content and rights data with any structure and controlled vocabularies to be mapped and integrated, either for querying or when dealing with results.
